PROFESSIONAL SUMMARY

Full-Stack Developer who builds web and mobile applications end to end — from data modeling and API design to polished, real-time user interfaces. Systems Engineering student at UPSA (Bolivia) with internships at the National Statistics Institute (INE) and INFOCENTER, and a developer at CLJ Studio, where I build UPSA Eat, a campus marketplace in live use. Portfolio of production-grade projects: a real-time booking platform (NestJS + React Native) and a ride-sharing app powered by a custom .NET graph-routing engine. Comfortable across two backend ecosystems (Node.js/NestJS and ASP.NET Core), relational databases, and modern React tooling. Seeking a remote Full-Stack or Backend role where I can ship production features and keep growing.

TECHNICAL SKILLS

Programming Languages	TypeScript, JavaScript, C#, Python, C++, Dart, SQL
Backend	NestJS, Node.js / Express, ASP.NET Core, Flask, REST APIs, WebSockets (Socket.io), BullMQ
Databases	PostgreSQL, MySQL, Prisma, EF Core, Redis, stored procedures, DataGrip
Frontend & Mobile	React, Next.js, React Native (Expo), Flutter, Vite, Tailwind CSS, Radix UI, Framer Motion, React Query, Zustand
DevOps & Cloud	Git, Docker, Supabase, Netlify, Upstash, Fly.io, Vercel, Google Gemini API
Systems & Networking	Windows Server, Active Directory, FTP, Cisco Packet Tracer (OSPF, ACLs, VPNs), Tailscale
Spoken Languages	Spanish (native), English (C1 – Advanced)

EXPERIENCE

Intern · INFOCENTER

Sep 2026 – Present

IT Systems Intern · National Statistics Institute (INE)

Jun 2026 – Aug 2026

- Provided technical support for the regional office's computers: diagnostics, maintenance, and internal user assistance.
- Surveyed and technically reviewed the office's hardware fleet (CPUs, monitors, peripherals), identifying obsolete equipment and drafting replacement recommendations.
- Wrote institutional technical reports with documented inventory and annexes, following the agency's internal formats and procedures.
- Assisted with network and server administration and organized inventory data in control spreadsheets.

Freelance Software Developer · Self-employed

2023 – Present

- Design and build full-stack web and mobile applications for local businesses.
- Deliver real-time booking, POS, and marketing-site projects end to end (see Featured Projects).
- Own the full lifecycle: requirements, database design, API development, UI, and deployment.

Operations Assistant · Buy & Sell Business

Part-time

- Supported daily store operations, basic inventory control, and customer service.
- Assisted with day-to-day commercial transaction flows.

FEATURED PROJECTS

UPSA Eat — University Campus Marketplace (PWA)

CLJ Studio / Team

Flutter Web (PWA) · Supabase (PostgreSQL, Auth, Realtime, Storage, Edge Functions) · RLS · Web Push · Netlify

- Marketplace exclusive to the UPSA community, in open beta and in real use on campus: listings, stores, cart, real-time orders, and profiles with configurable privacy.
- Critical logic on the server: SECURITY DEFINER functions with atomic stock handling, RLS policies, institutional-email validation via database trigger, and two-sided delivery confirmation.

Billarmania — Real-Time Billiard Booking Platform

Personal

TypeScript monorepo · NestJS · Prisma · PostgreSQL (Supabase) · Redis / BullMQ · Socket.io · React Native (Expo) · React + Vite + Tailwind

- Architected a TypeScript monorepo with three apps — a NestJS API, a React admin/accounting dashboard, and a React Native client — sharing a common types package.
- Built real-time reservation updates with Socket.io and offloaded heavy work to background jobs using BullMQ + Redis.
- Implemented JWT auth, deposit/down-payment flows, PedidosYa-style inventory, file storage for receipts/QRs, and push notifications.

Autigres — Ride-Sharing Platform

Personal

React Native (Expo) · ASP.NET Core 8 (Clean Architecture) · EF Core · MySQL · Fly.io

- Built a ride-sharing mobile app backed by a .NET 8 API structured with Clean Architecture (API / Core / Infrastructure) and deployed on Fly.io.
- Engineered a custom routing engine: Dijkstra over an in-memory OpenStreetMap graph (27k nodes / 29k edges) returning routes in sub-millisecond time — no Google Maps dependency.
- Implemented JWT authentication and shared-ride pricing logic.

SRE Analytics Dashboard — Stochastic Analysis

Academic / Personal

Node.js · Express · MySQL · React 19 + TypeScript · Recharts · jstat

- Built a platform that ingests server latency logs and computes advanced statistics (Poisson, confidence intervals, Welch's t-test).
- Created a load generator producing realistic traffic via a normal distribution (Box-Muller), visualized live in an interactive dashboard.

FestCine — Film Festival Management System

Academic

MySQL 8 · Python 3 + Flask · Stored procedures & views

- Designed a normalized relational database (32 tables, 3NF) exposed exclusively through views and stored procedures — no embedded SQL.
- Built a Flask client for catalog, scheduling, ticketing, juries, and sponsorship management.

Additional projects: ViorelsMotors (AI-enhanced auto-shop site — React + Express + Google Gemini), English Learning Platform (React + Vite SSG + PWA), POS & inventory system (MySQL), and network/server infrastructure labs (Windows Server, Active Directory, Cisco Packet Tracer, Tailscale).

EDUCATION

B.Sc. in Systems Engineering — Universidad Privada de Santa Cruz de la Sierra (UPSA) — 2023 – Present

Secondary Education — Colegio Emprendedor — 2019 – 2022

Primary & Secondary Education — Colegio Franco Boliviano — 2008 – 2018
